# Motivation

We believe there is inherent value in representing a diverse set of backgrounds in media and entertainment. As members of minority groups, we want to visualize for filmmakers and studios that more diversity in films is a valuable goal.

# Objectives

Visualize how minority representation in American film correlates to various measures of success of the film.

# Data

Gathered data on film production staff from IMDb. Gathered character word count data directly from movie scripts.

# Features

## *On camera representation of minorities*

- Indicate women, ethnic groups, sexuality
- On camera
- Role type
- Movie genre
- Year released

## *Off camera representation of minorities (optional)*

- Indicate women, ethnic groups, sexuality
- Movie genre
- Year released

## *Film success*

- Critical acclaim
- Box office stats
- Total gross
- Public opinion of film (optional)

## *Societal outcomes (optional)*

- Youth self confidence measures
- Public opinion of minority group

# Movies to Investigate

We chose 10 movies released in 2016 for their box office gross, critical acclaim, and variety of genres represented. The movies we investigated further are:

- Arrival
- Batman vs Superman
- Captain America: Civil War
- Hidden Figures
- Jackie
- La La Land
- Lion
- Manchester By The Sea
- Moonlight
- Rogue One

| Movie                 | Name              | Gender | Race  | LGBTQ?   |
|-----------------------|-------------------|--------|-------|----------|
| Moonlight             | Adele Romanski    | Female | White | Straight |
| Moonlight             | Jeremy Kleiner    | Male   | White | Straight |
| Moonlight             | Dede Gardner      | Female | White | Straight |
| La La Land            | Jordan Horowitz   | Male   | White | Straight |
| La La Land            | Fred Berger       | Male   | White |          |
| La La Land            | Marc Platt        | Male   | White |          |
| La La Land            | Gary Gilbert      | Male   | White |          |
| Lion                  | Iain Canning      | Male   | White |          |
| Lion                  | Angie Fielder     | Female | White |          |
| Lion                  | Emile Sherman     | Male   | White |          |
| Hidden Figures        | Pharrell Williams | Male   | Black | Straight |
| Hidden Figures        | Theodore Melfi    | Male   | White | Straight |
| Hidden Figures        | Donna Gigliotti   | Female | White |          |
| Hidden Figures        | Peter Chernin     | Male   | White | Straight |
| Hidden Figures        | Jenno Topping     | Female | White | Straight |
| Manchester by the Sea | Matt Damon        | Male   | White | Straight |
| Manchester by the Sea | Kimberly Steward  | Female | Black |          |
| Manchester by the Sea | Kevin J. Walsh    | Male   | White |          |
| Manchester by the Sea | Chris Moore       | Male   | White | Straight |

# Methods

In order to gather the custom data we needed to tell our story, we combed through the scripts of the 10 movies we chose and counted up the number of words each character spoke. We made note of the character's gender, race, and sexual orientation, if available.

We also gathered film maker data for each of the movies from IMDb and other sources of information about the film. We looked specifically at the gender, race, and sexual orientation of the films producers, directors, and writers,

# Cleaning

Once all the script data was gathered, we had to clean it to be sure we had the most useful set possible. We eliminated unnamed characters to narrow the data set. We also unified categories and capitalization across the data, to make it easier to prototype and code visualizations.

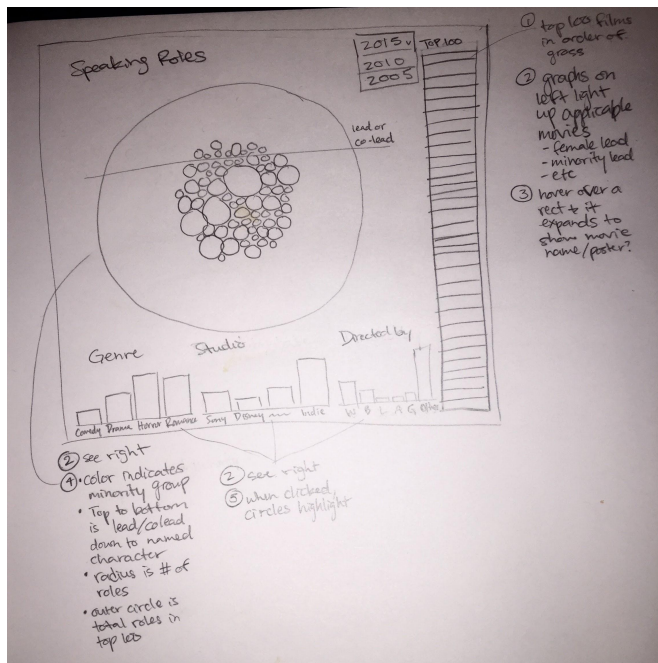

# Structuring the Story

*Film executives, stop patting yourselves on the back*

The state of diversity in film and the business case for more diversity

1. 2016 seemed like a great year for diversity in film
  - a. Upward trend of women making films
  - b. Celebrated films like Moonlight, Hidden Figures, Arrivals
2. Pipeline film production > film cast > film viewership
  - a. Is not representative
3. How much do people care about seeing themselves represented
  - a. Higher median box office gross and ROI for film with casts that have representative ratio of minorities (compared to US pop)
  - b. Token casting isn't enough
  - c. General public outcry for more diverse films
4. Look deeper into 8 movies from 2016
  - a. Words spoken as representation of women vs men - more men
  - b. Words spoken as representation of races - few minorities
  - c. Sexual orientation?
  - d. What does it take for a female character to have a name? - fewer female peripheral characters with names
  - e. Call out specific differences we find interesting
    - i. Hidden Figures white male boss vs. black female lead

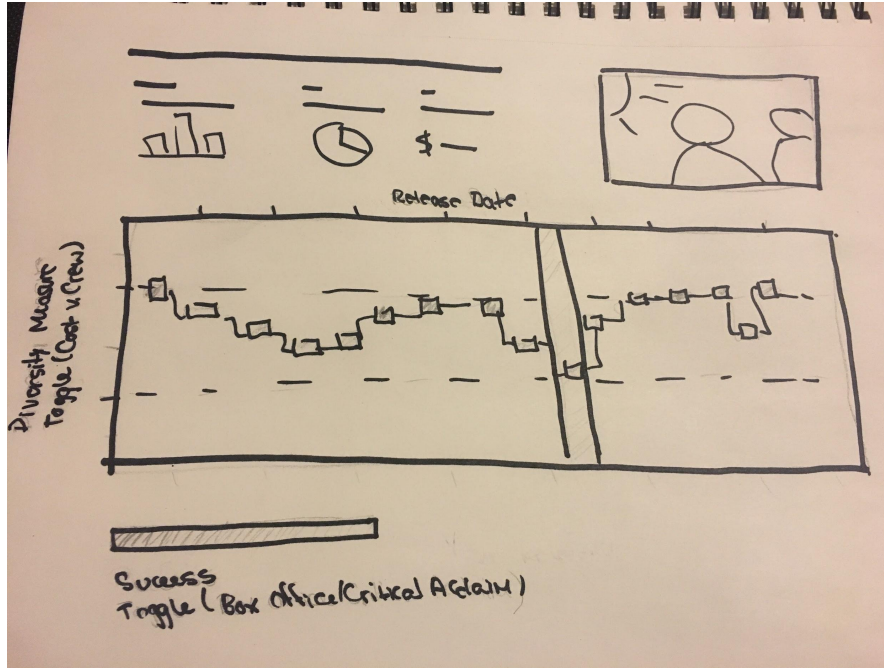

# Initial Sketches

This interactive visualization shows the proportion of speaking roles held by different minority groups. The bubble graph is connected to the bar graphs on the bottom and the full list of the top 100 films of 2015 on the right. The top 100 list can also be explored by hovering and clicking.

## ITERATIONS & REASONING

This visualization depicts movies organized by release date, a diversity measure, and success. The two axes (diversity and success) can toggle between two measures: cast/crew and gross/critical acclaim. When a film is highlighted, the more statistics about the film can be seen at the top. This visualization can also show the statistics for one movie, using the metrics of time on screen speaking for minority and women actors.

## ITERATIONS & REASONING

On the left, is a sunburst diagram with directors at the centre, radiating out to producers, cast and crew data. The different demographic factors we are interesting in looking at, such as gender and race, will be colour coded into the sections to see how the more powerful people at the centre impact the people further out in the diagram.

On the right is a parallel coordinates plot. The furthest left axis represents the demographic information about the director, the middle represents the same about the cast, and the left represents the same about the people who purchased tickets to see the movie in theatres. Through linking and brushing you could highlight how each demographic category on each axis impacts the others.

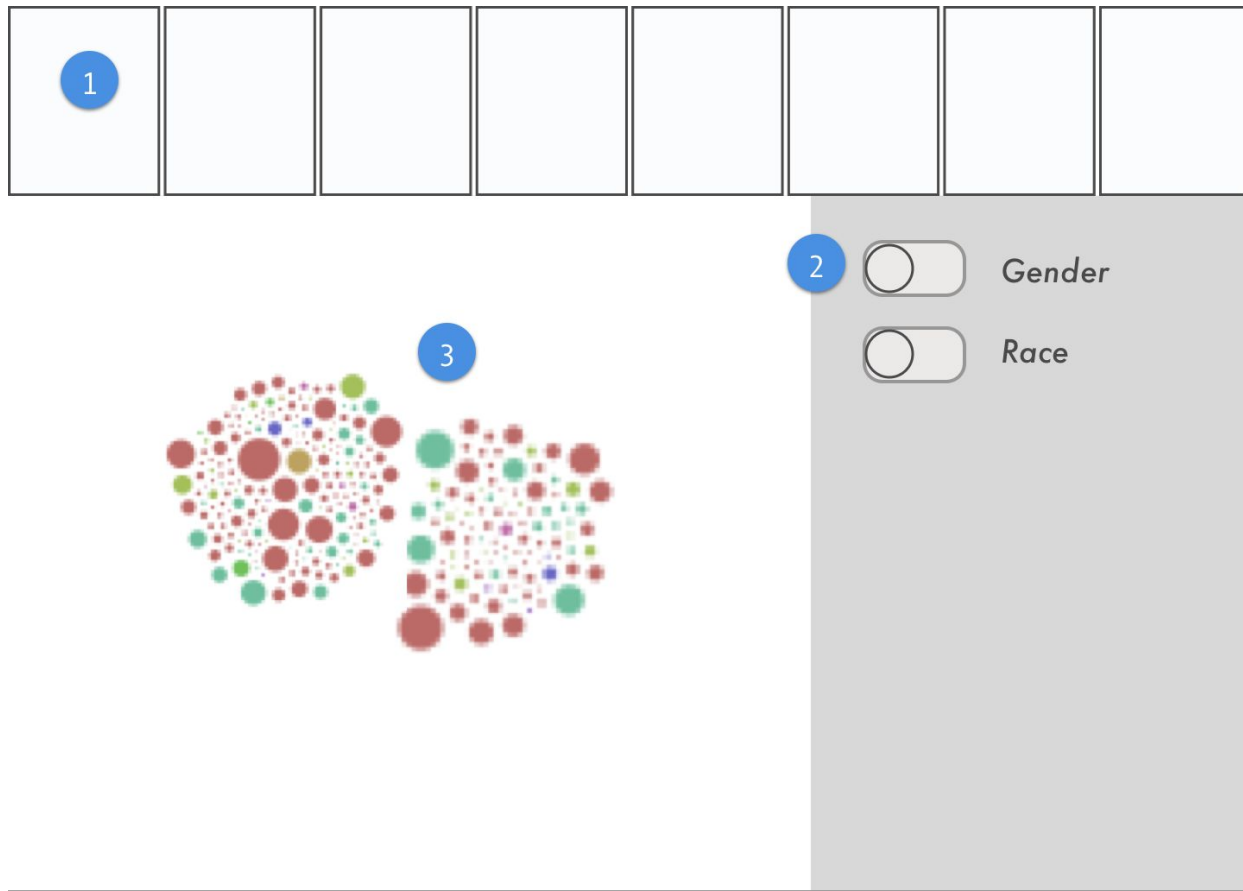

# Iterations

So after we gathered our data and discussed about the initial graphs, we collect things we like and would love to work on:

1. Showing all the character data on one graph and allowing filtering
2. Bubble graphs to show size of bubble = words spoken
3. Filtering by film
4. Filtering by gender and race - simultaneously or one at a time

# Hi-Fi mockups

## Default view

1. Movie posters for each of the 8 movies.

2. Switches to group bubbles differently - default both off

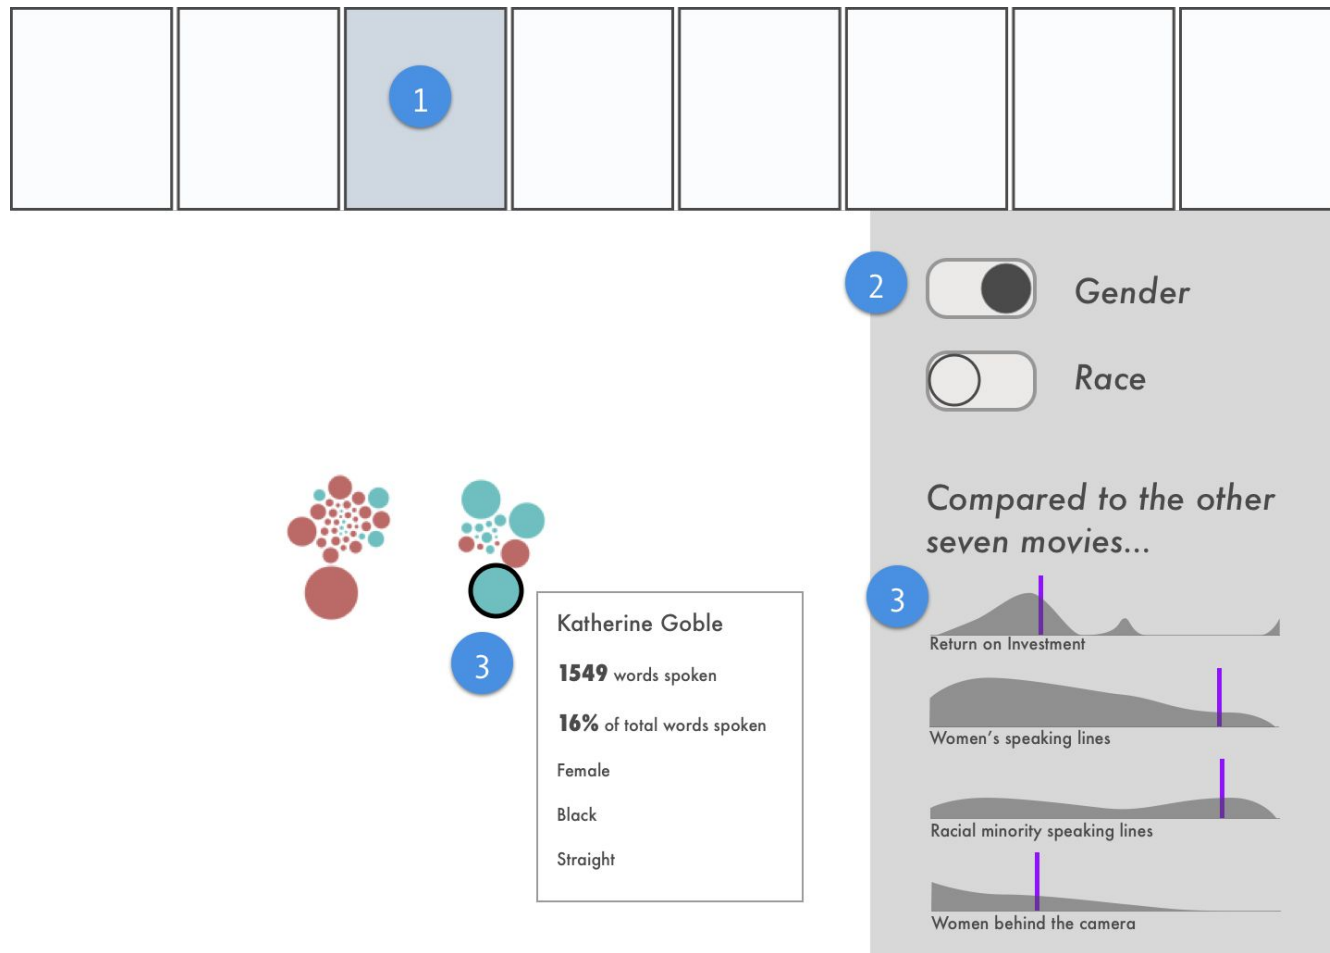

On click, groups bubbles by feature

Can have both switches on or off

3. Bubbles represent each character:

- Size = total words spoken
- Color = race

## ITERATIONS & REASONING

### Default view

1. Hidden Figures clicked. One movie selected at a time

On click, filters bubbles to only characters from that film.

On click, individual movie data appears below switches.

2. Switch on for Gender grouping, shows bubbles grouped by gender

3. Histograms comparing distribution of different factors across all 8 movies.

Shows where currently selected movie falls.

4. On hover over individual button, show character name, total word count, gender, race, sexual orientation

## ITERATIONS & REASONING

We tried bubble chart and it ended up not helping with details we'd love to deliver. Therefore we also tried alluvial diagram, using our real data on RAW. We did user testing with our peers and got the following feedback:

1. Hard to connect percentages to particular character
2. Hard to know what groups each character belongs to

## ITERATIONS & REASONING

Another alternative we came up with is this visualization. Films are organized by ROI, then characters and creators are shown on that line.

We also showed this to peers and got the following feedback:

1. Doesn't understand ROI graphs - make them 36x instead of percentages?
2. Creators looks like it's part of the character data - use different visual encoding?
3. Hard to draw conclusions from data on your own - add annotations?

# Final Visuals

### ROI

Return on Investment (ROI) represents how much money the movie made compared to what it cost to make. The higher the better! *Moonlight*, the only film on this list with a black director and all black cast, had a 3610% ROI. Compare that to *Batman vs Superman*, which had only a 249% ROI. In general, films with more diverse creators and casts garner higher ROI.

### Character's Percent of Words Spoken

Each circle represents a named character and the percent of words they spoke from the total words spoken in the film. Despite the diversity of the 2016 films we chose, the named characters with more words spoken are predominantly white and male. Even in a groundbreaking film like *Hidden Figures*, the character who spoke the most words is not the main character, the black, female scientist Katherine Goble, but her white, male boss, Al Harrison.

### Filmmakers

Each square represents a producer, writer, or director of a film. As you can see, filmmakers are overwhelmingly white and male. However, of the top 5 highest ROI films, 4 out of the 5 have at least one woman behind the camera, and 3 have at least one person of color among the film creators.

# Sharing the Code

Once we narrowed in on the structure of our final visualization, Courtney built the scaffolding for the visualization in HTML and d3, and split up the work. We each focused on different components of the visualization, committing our changes to the GitHub repository we shared.

This allowed us to increase our efficiency as a team and keep from weighing down any one team member.

# Final Product

## Movie Diversity Visualization

Below is a chart visualizing the diversity of 10 popular movies of 2016. Some were celebrated for their perceived diversity, but upon further investigation we discovered that representation may not be as diverse as it seems.

### Filter Buttons

### Return on Investment

### Character's Percent of Words Spoken in Film
